

A New Paradigm for Molecular Imaging

The world's need for PET radiopharmaceuticals is growing steadily. The key to growth and greater utilisation of molecular imaging is the development of new and more specific biomarkers. At PETNET Solutions, we consider this to be the next step in expanding molecular diagnostics from research to patient care.

That's why PETNET Solutions is collaborating with some of the world's leading research organisations to develop specific molecular biomarkers that will allow physicians to transition from treating the illness to treating the individual. We are about to enter an era of extraordinary change where these new biomarkers will expand the boundaries of molecular imaging and lead us to the promise of personalised medicine. Now that is progress. As molecular imaging evolves, PETNET Solutions delivers products and services that expand the value of PET to providers, referring physicians and patients.

PETNET Solutions is Delivering, Expanding and Advancing the science of PET.

"The future expansion of PET depends on the development of new molecular imaging biomarkers. Advances in molecular medicine require the rapid incorporation of molecular imaging into mainstream medicine."
